

Grapple for Forklift

Forklift Grapple - Grapples work together with the crowning operation of the bucket cylinder located on the excavator. They can mount directly onto the jib or any quick hitch that is in bucket position. Grapples are usually meant for the processing and handling of construction materials, timber, domestic and aggregate waste items. The grapple's boxed design has additional support bridging. This manufactured design provides the grapple with maximum support and strength by means of preventing the body from breaking and turning during its function.

The grapple together with all of its moving parts are constructed of hardened steel. The rotating points are designed to be able to guarantee holding ability and supreme closing force. The operator has the capacity to handle all sizes and varieties of materials utilizing the jaws built-in at the end part of the grapple with toes. This enables the jaws to close through one another in a finger configuration for maximum handling capacity.
